

OPENING lights

Our Side Hung Access Opening Lights offer a means of occasional external access to the building or internal access to the roof space where laylights prevent access from below.

This product utilises the same extrusions as our main top hung opening light and can be supplied to any size up to 750mm wide by 1250mm deep.

Access vents are mainly used by maintenance workers to gain entry to the roof area and the use of either a ladder or tower scaffolding to safely climb through the opening may be required.

If the access lights are to be used on a more regular basis then it is suggested that the building designer incorporates a permanent structure below to provide a safe passage for the user.

This product is fitted with either pneumatic gas struts or manual hold open stays and can be supplied with internal locking handles and external pull handles with safety and security in mind.

The versatile design of our opening lights enables them to be incorporated into all of our glazing systems with any infill material from 6mm to 28mm thick.

To guarantee water tightness, roof vents must be installed to a minimum of 15°.
